Pilot whales, either of two species of small, slender toothed whales with a round bulging forehead, a short beaklike snout, and slender pointed flippers. Pilot whales are about 4–6 metres (13–20 feet) long, with males larger than females. A pair of short-finned pilot whales (Globicephala macrorhynchus) swimming together off the coast of the island of Hawaii. Pilot whales are about 4–6 metres (13–20 feet) long. © Michael Nolan—SplashdownDirect/Shutterstock.com. Short-finned pilot whales (Globicephala macrorhynchus) are distributed in all oceans (...here...). The IUCN Red List of threatened species classifies this species as data deficient. Furthermore, pilot-whales.org provides scientific guidance on several biological life aspects of this species obtained from own research and from reports of the scientific community. Background informations on pilot-whales.org (...here...).

Pilot-whales.org does not conduct research solely on pilot whales. Positions of Pilot Whales from 1999 to 2015. 2012 and 2013 were the years in which we found the Pilot Whales most westerly. In 2013, the different groups were sighted closer together. Unlike 2008, this year also saw larger groups of Pilot Whales with newborns on average more westerly than all other groups. This is remarkable and could have something to do with the port of Tangier Med. Buy a cheap copy of Pilot Whales book by Kristin Petrie. Whales are among the largest animals on earth.
